Digital technologies as a factor of change in the Russian Federation

V. Kharchenko

It is defined the essence of the process of introducing digital technologies that change the forms and methods of economic life. It is named five modern breakthrough technologies that must be strongly promoted. To absorb the changes, it is compared the approaches of scientists, entrepreneurs, politicians and public figures. It is examined the views of scientists who see it as a tool of radical changes in public life and those who hoped that digitalization will become an alternative to the less successful reforms. It is considered the scientific problem of the classification of the digital economy to tools for creating public goods or the process of socio-economic transformation based on mass introduction and mastering of digital technologies, i.e. technologies create, process, and use information.

Keywords: *digital economy, digitalization, the third industrial revolution, post-industrial society, new industrial society; technotronic society, cognitive society, the theory of "common-wealth, society theory of mass consumption of information technology, the Internet, global digital market, Russian model digital economy*
