Language and thinking: correlation problem

V.M. Levin, A.N. Burlutskiy, N.G. Keleberda

It is expressed a doubt in the validity of popular belief according to which language (and consciousness) and thinking are inseparably linked and generate each other. The provision that the thinking and consciousness come from various parts of work process is proved: the thinking comes from people's relation to the nature, and consciousness — from social human relations. It is noted that having been a consequence of their synthesis the appearance of conscious (language) thinking not only lifts thinking on qualitatively higher step, but also generates oblivion of its conditionality with human being.

Keywords: *anthroposociogenesis, mentality, language, consciousness, division of manual and intellectual labour*
