Youth employment: global trends in the post-pandemic world

A. Dzhioev

The Covid-19 pandemic has had a significant impact on national labor markets, with young workers across the world experiencing significantly less coronavirus infection than middle-aged and older workers. Time has shown, however, that it is young people who have been hit the hardest by the pandemic, and youth labor markets continue to suffer from the ongoing effects of the pandemic, geopolitical risks and macroeconomic risks. The article systematizes global trends in the youth labor market, which helps to determine the global priorities and trends in the employment of young people in the future.

Keywords: *post-pandemic labor market, gender differences in the youth labor market, regional features of unemployment, youth employment prospects*
